Haruta N; Eggler AL, Cox MM, Lusetti SL,

WPI; 2004-580265/56. N-PSDB; ADR16429 New RecA mutant proteins comprising a single mutation or a double mutation, useful for catalyzing homologous DNA pairing and DNA strand exchange reactions in an in vitro or in vivo environment.

Claim 2; SEQ ID NO 1; 34pp; English.

The invention relates to an isolated RecA mutant protein, where the protein is either a single mutant RecA protein comprising a deletion of amino acid residues from the carboxyl terminus, or a double mutant RecA protein comprising a deletion of amino acid residues from the carboxyl terminus and an amino acid change from a glutamate to a basic amino acid. The invention also relates to a polynucleoride sequence that encodes the RecA mutant protein, a method of catalysing an in vitro homologous DNA pairing and DNA strand exchange reactions comprising providing an amount

```
a cell comprising aupplying to the cell an amount of the RecA mutant contributed and cell an amount of the RecA mutant protein comprises an enhanced capacity to displace a DNA binding protein compared to wild-type RecA. The DNA binding protein is from Escherichia coll (SSB).

C talso comprises enhanced binding protein from Escherichia coll (SSB).

C traction as compared to wild-type RecA. The composition and methods are useful for catalysing homologous DNA pairing and DNA strand exchange creactions in an in vitro or in vivo environment. These may be used in promoting in vitro alterations of genes to permit the rapid construction of desired gene mutants for industrial and pharmaceutical purposes. The cutant proteins may also be used in targeting the site-specific classage of small and large DNAs, or as a basis for the design and construction of tiny electronic circuits based on DNA. This sequence represents a RecA
                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   241 ETRVKVVKNKIAAPFKQAEFQILYGEGINFYGELVDLGVKEKLIEKAGAWYSYKGEKIGQ 300

The invention relates to an isolated RecA mutant protein, where the protein is either a single mutant RecA protein comprising a deletion of amino acid residues from the carboxyl terminus, or a double mutant RecA protein comprising a deletion of amino acid residues from the carboxyl terminus and an amino acid change from a glutamate to a basic amino acid. The invention also relates to a polynucleotide sequence that encodes the RecA mutant protein, a method of catalysing an in vitro homologous DNA pairing and DNA strand exchange reactions comprising providing an amount of the RecA mutant protein and a method of increasing recombination of the RecA mutant protein and a method of increasing recombination of the RecA mutant protein as comprises an enhanced capacity to comprising supplying to the cell an amount of the RecA mutant protein as comprises an enhanced capacity to displace a DNA binding protein is the ssDNA binding protein from Esperature comprises enhanced binding to DNA strand exchange reaction as comprises enhanced binding to DNA during and DNA strand exchange consection is the ssDNA binding protein from Esperature and methods are reactions in an in vitro alld-type RecA. The composition and methods are useful for catalysing homologous DNA pairing and DNA strand exchange consections in an in vitro alterations of genes to permit the rapid construction of desired gene mutants for industrial and pharmaceutical purposes. The mutant proteins may also be used in transquering the site-specific cleavage of small and large DNAs, or as a basis for the design and construction of tiny electronic circuits based on DNA. This sequence represents the wild-type RecA protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   241 ETRVKVVKNKIAAPFKQAEFQILYGEGINFYGELVDLGVKEKLIEKAGAWYSYKGEKIGG 300

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents the recA protein. The wild type recA protein was used to produce hyperrecombinogenic variants (see AAV68828-32), using the method of the invention. The specification describes a method for producing a library of diverse multicellular organisms using pools of male and female gameres. At least one of the male pool or female pools comprises a number of different gametes derived from different strains of a species or of a different species. The viable organisms produced from the fertilized gametes are repeatedly crossed to produce a

Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated or list fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway or that has an activity against a biological pathway or equired for proliferation, or that inhibits proliferation; (8) identifying a gene required for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound activity; (11) a compliant or the strains is present in a culture or collection of the which each of the strains is present in a culture or collection of the which each of the strains is present in a culture or collection of proliferation of an organism. The antisense nucleic acids are useful for dentifying proteins or sereains for homologous nucleic acids required for the displace and acids required for formal and accide and acids required for formal and accide and acids required for formal accided and activity of the accenning to homologous nucleic acids required for accided and activity accenning the candidate molecules for rational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fighthiphophished_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           invention relates to an isolated nucleic acid comprising any one of

            property. The methods can be used to evolve cells to acquire a desired property such as heat tolerance, ethanol production or tolerance, acid, improved production and maintenance of enzyme cofactors or NAD(P) H and improved glucose transport. The desired property may be expression of a protein or primary or secondary metabolite. Alternatively the desired property is secretion of a protein or secondary metabolite, chosen from taxol, cyclosporin A and erythromycin. The desired property may be a capacity for meiosis or compatibility to form a heterokaryon with another
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               recA; hyperrecombinogenic variant; male gamete; female gamete; heat tolerance; ethanol production; ethanol tolerance; metabolite; taxol; cyclosporin A; erythromycin; meiosis.

The present sequence represents a hyperrecombinogenic rech protein. The wild type rech protein (AAY68827) was used to produce hyperrecombinogenic wild type rech protein (AAY68827) was used to produce hyperrecombinogenic variants, using the method of the invention. The specification describes camethod for producing a library of diverse multicellular organisms using pools of male and female gametes. At least one of the male pool or female pools of male and female gametes at least one of the male pool or female pools of strains of a species or of a different gametes derived from different consists. The viable organisms produced from the fertilized gametes are repeatedly crossed to produce a library of diverse organisms, which are selected for a desired trait or property. The methods can be used to evolve cells to acquire a desired comproved production and maintenance of enzyme cofactors or NAD(P)H and improved glucose transport. The desired production not a protein or secondary metabolite. Alternatively the desired property is secretion of a protein or secondary metabolite, chosen from the capacity for meiosis or compatibility to form a heterokaryon with another
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    240

The invention relates to a method of evolving cells to acquire a desired protoplasts of different cells, fusing the protoplasts of protoplasts from protoplasts of com hybrid protoplasts from protoplasts from the companies, includating protoplasts from protoplasts recombine to form hybrid protoplasts in which genomes from protoplasts recombine to form additional hybrid genomes and incubating additional hybrid protoplasts for producing additional hybrid protoplasts for genomes from protoplasts recombine to form additional hybrid genomes and incubating protoplasts for producing additional hybrid protoplasts for producing additional hybrid protoplasts for genomes and different producing protoplasts for genomes and a pool of female gametes or different gametes derived from different strains of a species or different gametes derived from different strains of a species or different gametes derived from different strains of a species or different gametes derived from different strains of a species or grow into reproductively viable centured property. The methods are useful for evolving cells to organisms, repeatedly crossing the reproductively viable organisms to desired property is methodicity or forman centured property. The method and maintenance of enzyme coffactors, improved production and maintenance of enzyme coffactors, improved production and maintenance of enzyme coffactors, improved production and maintenance of enzyme team, coffactors, improved production and maintenance of enzyme coffactors, deficient by the method is also useful for predicting efficacy of a drug in treating viral o
                                                                                                                                                                                                                                                                                                                                   ğ
                                                                                                                                                                                                                                                                                                                     Evolving cells to acquire a desired property, by forming protoplasts different cells, fusing protoplasts to form hybrid protoplasts (HP), producing regenerated cells, forming additional HP and producing additional regenerated cells.

The invention relates to a method of evolving cells to acquire a desired protoplasts to forming protoplasts of different cells, fushing the protoplasts to form hybrid protoplasts. Incubating the hybrid protoplasts to produce regenerated cells, repeatedly forming protoplasts from regenerated cells, fusing protoplasts to form hybrid protoplasts in which sonomes from protoplasts recombine to form additional hybrid genomes and incubating additional hybrid protoplasts for producing additional regenerated cells. The invention also relates to a method of producing a library of diverse multicellular organisms involving providing a pool of male gametes and a pool of female gametes, where one of the male pool or the female pool comprises several different sametes derived from different strains of a species or different species and the male gametes

certilise the female gametes, permitting at least a portion of the resulting fertilised gametes to grow into reproductively viable organisms to organisms, repeatedly crossing the reproductively viable organisms to produce a library of diverse organisms and selecting the library for a certification by a second result of production and maintenance of enzyme channol tolerance, improved production and maintenance of enzyme cofactors, improved production and maintenance of maryme cofactors, improved production and maintenance of MAD(P)H and improved glucose transport. The desired property is the secretion of a protein or secondary metabolite, the secretion of a protein or captualition of desired properties such as enhanced recombinogenicity, gene copy number or gene reductivity and capacity for expression and/or secretion of proteins or secondary metabolites. The method is further to useful for predicting efficacy of a drug in treating viral infection, plant genome shuffling, micropore manipulation, producing transgenic animals, improvement of overexpressed genes for a desired phenotype and the mathod are inseful in malant contractors. e method are useful in molecular genetics. This sequence represents coli reca protein clone used in the method of the invention. the method 898888888888888888888888888888888

The invention relates to a method of evolving cells to acquire a desired property by forming protoplasts of different cells, fusing the protoplasts of protoplasts to come hybrid protoplasts from the protoplasts from the protoplasts in which coprotoplasts to form hybrid protoplasts in which capenemes from protoplasts to form additional hybrid genomes and incubating additional hybrid protoplasts form additional hybrid genomes and incubating additional hybrid protoplasts for genomes from protoplasts recombine to form additional hybrid genomes and incubating additional hybrid protoplasts form additional hybrid genomes and incubating additional hybrid protoplasts form additional hybrid genomes and incubating additional hybrid protoplasts form additional hybrid genomes and incubating deference and the feather strains of a species or different genetes for producing a pool of the female genetes, permitting at least a portion of the certilised genetes, permitting at least a portion of the resulting fertilised genetes, permitting at least a portion of the centilised genetes, permitting at least a portion of the centilised genetes, permitting and selecting the library for a cquired train or property. The methods are useful for evolving cells to cquired easired properties such as heat tolerance, ethanol production, cthanol tolerance, improved production and maintenance of enzyme cofactors, improved production and maintenance of NAD(P)H and improved production and maintenance of NAD(P)H and improved cofactors, improved production and maintenance of NAD(P)H and improved care secondary metabolite, the secretion of a procein or transpired erransport. The desired properties such as enhanced recombination, careful for explaints and erythromychin. The method is also useful for predicting efficacy of a drug in treating viral pernome shuffling, micropore mainpulation, producing transgenic contarned pernome shuffling, micropore maintenance organisms. The method are useful in molecular genetics. This sequence contary metabolity and t
                                                                                                                                                                                                                                                                                                                  Evolving cells to acquire a desired property, by forming protoplasts different cells, fusing protoplasts to form hybrid protoplasts (HP), producing regenerated cells, forming additional HP and producing additional regenerated cells.

The wild type recA protein (APK50827) was used to produce hyperrecombinogenic variants, using the method of the invention. The specification describes a method for producing a library of diverse multicellular organisms using pools of male and female gametes. At least one of the male pool or female pools of male and female gametes. At least one of the male pool or female pools of different gametes derived from different strains of a species or of different species. The viable organisms is produced from the fertilized gametes are repeatedly crossed to produce a library of diverse organisms, which are selected for a desired trait or property. The methods can be used to evolve calls to acquire a desired composerty such as heat tolerance, ethanol production or tolerance, acid, improved production and maintenance of enzyme cofactors or NAD(P)H and improved broduction and maintenance of enzyme expression of a protein or primary or secondary metabolite. Alternatively the desired
                                                                                      recA; hyperrecombinogenic variant; male gamete; female gamete;
heat tolerance; ethanol production; ethanol tolerance; metabolite; taxol;
cyclosporin A; erythromycin; meiosis.

recursive sequence recombination; evolution

```
protein is either a single mutant Rech protein comprising a deletion of amino acid residues from the carboxyl terminus, or a double mutant Rech protein comprising a deletion of amino acid residues from the carboxyl terminus, or a double mutant Rech protein comprising a deletion of amino acid residues from the carboxyl terminus and an amino acid change from a gultamate to a basic amino acid. The invention also relates to a polymucleotide sequence that encodes the Rech mutant protein, a method of catalysing an in vitro homologous DNA pairing and DNA strand exchange reactions in of the Rech mutant protein and a method of increasing recombination of the Rech mutant protein and a method of increasing recombination of efficiency of homologous DNA pairing and DNA strand exchange reactions in comprising supplying to the cell an amount of the Rech mutant protein as compared to wild-type Rech. The DNA binding protein is the sapNA binding protein from Escherichia coli (SSB). It also comprises enhanced binding protein from Escherichia coli (SSB). It also comprises enhanced binding protein from Escherichia coli (SSB). Creaction as compared to wild-type Rech. The DNA creaction as compared to wild-type Rech. The composition and methods are reactions in an in vitro or in vivo environment. These may be used in promoting in vitro alterations of genes to permit the rapid construction of the mutant proteins may also be used in targeting the site-specific cleavage of mutant proteins passed in targeting the site-specific cleavage continy enterminate proteins as a basis for the design and construction of circuits based on DNA. This sequence represents a Rech
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        120

Escherichia coli; recA protein; hyperrecombinogenic variant; Minshall;

```
The present invention provides methods employing iterative cycles of recombination and selection/screening for evolution of whole cells and organisms toward acquisition of desired properties, e.g. enhanced recombinosenicity, genome copy number, and capacity for expression and/or secretion of proteins and secondary metabolites. The present sequence represents a wild-type recA protein (designated new Minshall), from an example of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Evolution of whole cells and organisms by recursive DNA sequence recombination in cells to evolve cells having acquired desired function, useful in methods for predicting the efficacy of a drug in treating viral or pathogenic infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               67 IVELYGPESSGKTTLTLQVIAAAQREGKTCAFIDAEHALDPIYARKLGVDIDNLLCSQPD

The present sequence represents a hyperrecombinogenic recA protein. The wild type recA protein. (AAY68827) was used to produce hyperrecombinogenic variants, using the method of the invention. The specification describes a method for producing a library of diverse multicallular organisms using pools of male and female gametes. At least one of the male pool or female pools of male and female gametes. At least one of the male pool or female pools comprises a number of a different species. The wiable organisms to pools comprises or of a different species. The viable organisms of a species or of a different species. The viable organisms of produce from the fertilized gametes are repeatedly crossed to produce a library of diverse organisms, which are selected for a desired trait or property. The methods can be used to evolve cells to adust a desired improved production and maintenance of enzyme cofactors or NAD(P)H and improved glucose transport. The desired property may be expression of a protein or primary or secondary metabolite. Alternatively the desired property is secretion of a protein or secondary metabolite, chosen from taxol, cyclosporin A and erythromycin. The desired property may be a capacity for meiosis or compatibility to form a heterokaryon with another

2004-507924/49. WPI; 2004-507924/ N-PSDB; ADQ87816. Evolving cells to acquire a desired property, by forming protoplasts of different cells, fusing protoplasts to form hybrid protoplasts (HP), producing regenerated cells, forming additional HP and producing additional regenerated cells.

Disclosure, Fig 13; 196pp; English.

The invention relates to a method of eviving cells to additing the property by forming protoplasts of different cells, fusing the protoplasts to form hybrid protoplasts, incubating the hybrid protoplasts from regenerated cells, fusing protoplasts to form hybrid protoplasts from regenerated cells, fusing protoplasts to form hybrid protoplasts in which genomes from protoplasts recombine to form hybrid protoplasts in which cell conclusions additional hybrid genomes and cells. The invention also relates to a method of producing a library of diverse multicellular organisms involving providing a pool of cells invention also relates to a method of producing a library of diverse multicellular organisms involving providing a pool of the female gametes and a pool of fiderent strains of a species or different species and the male gametes of certilise the female gametes, bermitting at least a portion of the centuring fertilise dametes to grow into reproductively viable organisms to organisms, repeatedly crossing the reproductively viable organisms to organisms, repeatedly crossing the reproductively viable organisms to desired properties such as heat tolerance, ethanol production, ethanol tolerance, improved production and maintenance of enzyme cofactors, improved production and maintenance of enzyme cofactors, improved production and maintenance of may a protein or primary metabolite or secondary metabolite, the secretion of a protein or invention relates to a method of evolving cells to acquire a desired

```
secondary metabolite, capacity for meiosis or compatibility to form a heterokaryon with another strain. The secondary metabolite is chosen from taxol, cyclosporin A and erythromycin. The method is also useful for acquisition of desired properties such as enhanced recombinogenicity, gene copy number or gene reductivity and capacity for expression and/or secretion of proteins or secondary metabolites. The method is further useful for predicting of escondary metabolites. The method is further useful for predicting micropore manipulation, producing transgenic animals, improvement of overexpressed genes for a desired phenotype and reiterative pooling and breeding of higher organisms. The cells evolved by the method are useful in molecular genetics. This sequence represents an E. coli recA protein clone used in the method of the invention.
                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                           120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides methods employing iterative cycles of recombination and selection/screening for evolution of whole cells and organisms toward acquisition of desired properties, e.g. enhanced recombinogenicity, genome copy number, and capacity for expression and/or secretion of proteins and secondary metabolites. The present sequence represents a hyperrecombinogenic variant of a recA protein (see AAW64213), from an example of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Evolution of whole cells and organisms by recursive DNA sequence recombination in cells to evolve cells having acquired desired function, useful in methods for predicting the efficacy of a drug in treating viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            240

Database

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

recombination protein recA - Enterobacter agglomerans
Nalternate names: recombinase
Nalternate names: recombinase
C;Species: Enterobacter agglomerans
C;Species: Enterobacter agglomerans
C;Date: 13-Jan-1995 #sequence_revision 13-Jan-1995 #text_change 09-Jul-2004
C;Accession: S11481
R;Rappold, C.S.J.; Klingmueller, W.
submitted to the EMBL Data Library, January 1993
A;Description: Cloning and sequencing of the recA gene from Enterobacter agglomerans 33
A;Reference number: S31481
A;Status: preliminary
A;Accession: S31481
A;Status: preliminary
A;Residues: 1-354 <RAP>
A;Coss-references: UNIPROT: P33037; UNIPARC: UPI000016EC3A; GB:L03291; EMBL: Z19517; NID:
C;Genetics: A,Gene: recA S,Superfamily: recombination protein recA C;Superfamily: recombination; DNA recombination; DNA repair; nucleotide binding; P-loop C;Keywords: ATP; DNA binding; DNA recombination; DNA repair; nucleotide binding; P-loop F;67-74/Region: nucleotide-binding motif B F;141-146/Region: nucleotide-binding motif B F;73/Binding site: ATP (Lys) #status predicted 91.3%; Score 1532; DB 2; Length 354; Query Match

recombination protein recA - Yersinia pestis
NiAlternate names: recombinase A
C;Species: Versinia pestis
C;Species: Versinia pestis
C;Species: Versinia pestis
C;Species: Versinia pestis
C;Date: 06-Jan-1995 #sequence_revision 06-Jan-1995 #text_change 09-Jul-2004
C;Accession: S37586
R;Kryukov, V.M.; Suchkov, I.Y.; Sazykin, I.S.; Mishankin, B.N.
submitted to the EMBL Data Library, October 1993
A;Description: Complete nucleotide sequence of Yersinia pestis recA gene.
A;Reference number: S37586
A;Accession: S37586
A;Accession: S37586
A;Status: preliminary
A;Molecule type: DNA
A;Residues: 1-356 < KRY>
A;Cross-references: UNIPROT:P37858; UNIPARC:UP10000170617; EMBL:X75336; NID:g406793; PIC

Appreciaes: Vibrio anguillance Actions of the reck gene of Vibrio anguillance makes: Teconage of Accession: Odd 461

R, Accession: Odd 461

R, Accession: Odd 461

R, Tolmasky, M.E.; Gammie, A.E.; Crosa, J.H.
Gene 110, 41-48, 1992

A, Title: Characterization of the reck gene of Vibrio anguillarum.
A, Tatle: Characterization of the reck gene of Vibrio anguillarum.
A, Recession: Odd 461

A, Molecule type: DNA
A, Residues: 1-348 < TOL>
A, Rocession: Odd 461

A, Molecule type: DNA
A, Residues: 1-348 < TOL>
A, Ferences: UNIPROT: P26348; UNIPARC: UPI0000133544; GB: M80525; NID: G155256; PIDP
A, Experimental source: strains 775 and 531A
A, Experimental source: strains 775 and 531A
C, Function:
A, Gene: reck
C, Function:
A, Gene: reck
C, Function:
A, Gene: reck
C, Function:
A, Gene: reck
C, Superfamily: recombination protein reck
C, Superfamily: recombination protein reck
C, Superfamily: recombination protein reck

-!- FUNCTION: Can catalyze the hydrolysis of ATP in the presence of single-stranded DNA, the ATP-dependent uptake of single-stranded DNA by duplex DNA, and the ATP-dependent hybridization of homologous single-stranded DNAs. It interacts with lexA causing its activation and leading to its autocatalytic cleavage (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                        WICLEOTIDE SEQUENCE [LARGE SCALE GENOMIC DNA].

Sturcture of the recA protein-ADP complex.";

Nature 355:374-376(1992).

-! FUNCTION: Can catalyze the hydrolysis of ATP in the presence of single-stranded DNA, the ATP-dependent uptake of single-stranded DNA, by the ATP-dependent hybridization of homologous single-stranded DNAs. It interacts with lexA causing its activation and leading to its autocatalytic cleavage.
                                                                                                                                                                                                                                                                                                                                                                                                            C. Biotechnol. 21:1307-1313(2003).

-!- FUNCTION: Can catalyze the hydrolysis of ATP in the presence of single-stranded DNA, the ATP-dependent uptake of single-stranded DNA by duplex DNA, and the ATP-dependent hybridization of homologous single-stranded DNAs. It interacts with lexA causing its activation and leading to its autocatalytic cleavage (By
                                                                                                                                                                                                                                                                                                                                           05-JUL-2004 (Rel. 44, Created)

Natl. Acad. Sci. U.S.A. 101:11105-11110(2004).

-I- FUNCTION: Can catalyze the hydrolysis of ATP in the presence of single-stranded DNA, the ATP-dependent uptake of single-stranded DNA by duplex DNA, and the ATP-dependent hybridization of homologous single-stranded DNAs. It interacts with lexA causing its activation and leading to its autocatalytic cleavage (By

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PURATION: 11:179-197(2004).

-!- FUNCTION: Can catalyze the hydrolysis of ATP in the presence of single-stranded DNA, the ATP-dependent uptake of single-stranded DNA, by duplex DNA, and the ATP-dependent hybridization of homologous single-stranded DNAs. It interacts with lexA causing its activation and leading to its autocatalytic cleavage.
-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SMART; SM00382; AAA; 1.

J. Bacteriol. 172:342-349(1990).
J. PUNCTION: Can catalyze the hydrolysis of ATP in the presence of single-stranded DNA, the ATP-dependent uptake of single-stranded DNA, and the ATP-dependent hybridization of homologous single-strand DNA. It interacts with lexA causing its activation and leading to its autocatalytic cleavage.
J. SUBCELLUTAR LOCATION: Cytoplasmic (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 AIDENKOKALAAALGOIEKOFGKGSIMRLGEDRSMDVETISTGSLSLDIALGAGGLPMGR
